Friday - June 18

9:00 AM—4:30 PM

This year, in cooperation with Paragon Medical Education Group, MTEMSDA is offering a one of a kind hands-on educational experience. Each attendee will be introduced to high-fidelity scenarios and a procedural cadaver lab designed for Pre hospital Professionals.

This experience is like no other course you have ever experienced. Your skills will be put to the test as you are pressed into this intense experience where the focus is situational awareness combined with basic and advanced procedure applications. You'll learn and practice advanced lessons and procedures in human anatomy and physiology related to advanced airway techniques, high level venous access, and other basic and advanced techniques.

The most superior therapeutic interventions available in EMS today will be utilized to make this the best experience in EMS Education. With the use of both human cadavers and high-fidelity simulators you will leave the experience with a new confidence in both basic and advanced skill sets.

This educational experience will be used to measure all other courses in EMS you attend in the future.

What others are saying about the lab:

"All the essential components together in the cadaver/ simulation lab to make the experience truly one of a kind in EMS education. Students did more than observe their brains were provided multisensory immersion as they touched, participated and engaged with instructional staff in a unique and challenging learning environment. This whole-brain approach took into account that learning is an orchestrated neural symphony of stimulating many areas of the brain. The lab plays a perfect brain symphony, and it will resonate with EMS practitioners and educators for years to come."

Dr. Chris Nolette, President of the National Association of EMS Educators (NAEMSE)
